Algorithmic Toolbox
Data Structures and Algorithms

Learning Objectives

- Understand the meaning of Big- O notation.
- Describe some of the advantages and disadvantages of using Big- O notation.

Big- O Notation

Definition

$f(n) = O(g(n))$ (f is Big- O of g) or $f \preceq g$
if there exist constants N and c so that for
all $n \geq N$, $f(n) \leq c \cdot g(n)$.

Big- O Notation

Definition

$f(n) = O(g(n))$ (f is Big- O of g) or $f \preceq g$
if there exist constants N and c so that for
all $n \geq N$, $f(n) \leq c \cdot g(n)$.

f is bounded above by **some** constant
multiple of g .

Big- O Notation

Example

$$3n^2 + 5n + 2 = O(n^2) \text{ since if } n \geq 1, \\ 3n^2 + 5n + 2 \leq 3n^2 + 5n^2 + 2n^2 = 10n^2.$$

Growth Rate

$3n^2 + 5n + 2$ has the same growth rate as n^2

Using Big- O

We will use Big- O notation to report algorithm runtimes. This has several advantages.

Clarifies Growth Rate

Cleans up Notation

- $O(n^2)$ vs. $3n^2 + 5n + 2$.
- $O(n)$ vs. $n + \log_2(n) + \sin(n)$.

Cleans up Notation

- $O(n^2)$ vs. $3n^2 + 5n + 2$.
- $O(n)$ vs. $n + \log_2(n) + \sin(n)$.
- $O(n \log(n))$ vs. $4n \log_2(n) + 7$.
 - Note: $\log_2(n)$, $\log_3(n)$, $\log_x(n)$ differ by constant multiples, don't need to specify which.

Cleans up Notation

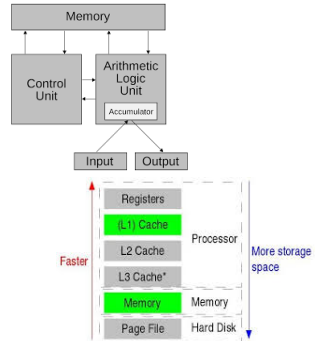

- $O(n^2)$ vs. $3n^2 + 5n + 2$.
- $O(n)$ vs. $n + \log_2(n) + \sin(n)$.
- $O(n \log(n))$ vs. $4n \log_2(n) + 7$.
 - Note: $\log_2(n)$, $\log_3(n)$, $\log_x(n)$ differ by constant multiples, don't need to specify which.
- Makes algebra easier.

Can Ignore Complicated Details

No longer need to worry about:

001001001
010011100
100101100
101101011

Warning

- Using Big- O loses important information about constant multiples.
- Big- O is *only* asymptotic.
